## CME for 19.1

1. According to the report in “Does the Timing of Depression Onset in Individuals with 2-Year Survival CAD Affect Mortality? A Nationwide Retrospective Study”, which was **NOT** a significant risk factor for all-cause hospitalization among CAD individuals with depression?  
(A) Gender  
(B) Age  
(C) Income  
(D) Comorbidities  
(E) Depressive disorder (after one month group)
2. Which of the following statements in “The Effects of MST on Nursing Home Residents with Sleep Disturbance” is **WRONG**?  
(A) Nursing home residents often experience sleep disorders  
(B) MST is Magnetic Stimulation Therapy  
(C) Cognitive function can assess by Mini-Mental State Examination Scale  
(D) MST was effective for improving rapid eye movement sleep time  
(E) MST was not an effective method to improve the objective sleep quality of nursing home residents with sleep disturbance
3. According to the article “Lithium Toxicity Related Parkinsonism in an Older Woman: Case Report and Literature Review”, which of the following statement is **WRONG**?  
(A) Lithium is commonly used to treat affective disorders  
(B) The most severe manifestations of lithium toxicity involve the central nervous system and kidneys, and some of these effects can be permanent  
(C) Younger adults eliminate lithium more slowly and are at higher risk of lithium toxicity than are older adults  
(D) The toxic effects of lithium mainly affect the kidneys, liver, heart, and glands but are usually mild and reversible  
(E) Lithium serum level of  $> 1.0$  mmol/L may cause neurological symptoms, and prolonged lithium intoxication can lead to permanent brain damage
4. What was **NOT** the limitation mentioned in the study of “Preliminary Results of Femoral Neck System in Treating Femoral Neck Fractures in Elderly Population”?  
(A) It was an observational and retrospective study design  
(B) The study lacked a control group for comparison  
(C) Most of variables do not exhibit statistically significant difference  
(D) Clinical and radiological outcomes were documented with a small patient cohort  
(E) FNS was released only in 2018, and it has been gradually used in our institute since 2022
5. According to the article “Pneumonia in Elderly Patients with Nasogastric Tubes: Factors to Consider” which was **NOT** a significant risk factor for community-acquired pneumonia (CAP) in elderly patients with nasogastric tubes?  
(A) Age  
(B) Female gender  
(C) Impaired consciousness  
(D) Excessive poly-pharmacy  
(E) A signed DNR
